Project 3 Reflection: Huffman and Dijkstra's

I felt that this project was reasonable in difficulty and size. The starting code was good as far as the testing and implementation was concerned. I did feel that the time frame was a little shorter than usual, but I think it was fair because the project was more or less straightforward with respect to information from the lecture and notes and outside sources. Perhaps for next time, more information should be given about imported elements in the code such as the Priority Queue, but I also realize the importance of DIY search engine utilization in the coding industry, so it didn't bother me that much, though some might have a harder time figuring out the right way to use such elements / class objects.
